INVENTORS: Ismail I. Walele
Samad A. Syed

TITLE: NOVEL ESTERS OF MONOMETHYL BRANCHED ALCOHOLS
AND PROCESS FOR PREPARING AND USING SAME IN
COSMETICS AND PERSONAL CARE PRODUCTS

BACKGROUND OF THE INVENTION

1. Field of the Invention

This invention relates generally to improved ester compositions, and more particularly to novel benzoate, octanoate, and maleate esters of monomethyl branched C16-C17 alcohols, their process of manufacture and their use as a cosmetic ingredient for toiletry and cosmetic formulations.

The esters are useful for cosmetics and personal care cleansing products, such as skin and hair care products, and soaps.

2. Description of the Related Art

Esters and acids are known for a variety of different applications for cosmetic, pharmaceutical and medicinal purposes. Benzoate esters of certain alcohols and alcohol mixtures, and their uses are disclosed in assignee's U.S Patent Nos. 4,275,222, 4,322,545, 4,323,693, and 4,323,694 all to Scala, Jr.; 4,278,655, and 4,293,544 both to Elmi; and 5,271,930, 5,270,421, and 4,791,097 all to Walele et al. The disclosures of these patents are incorporated herein by reference.

However, none of these references teach or suggest the specific novel benzoate, octanoate and maleate esters of monomethyl branched C16-C17 alcohols of this invention or the use of such ester compositions as emollients, moisturizers, sunscreen vehicles / solvents, etc.

OBJECTS AND SUMMARY OF THE INVENTION

It is an object of this invention to provide novel benzoate, octanoate and maleate esters of monomethyl branched C16-C17 alcohols having unique properties which make them uniquely suitable for use in cosmetics, skin care products, personal care products such as creams and lotions, and in other topical applications and products.

Another object of the invention is to provide branched monomethyl C16-C17 alcohol-based benzoate, octanoate and maleate esters having superior properties, namely improved tactile properties, better spreadability, better sunscreen solubility, less tackiness (stickiness) and greasiness on the skin, better suspension properties (in TiO₂), and more effectiveness in wetting and dispersing pigments.

These and other objects are obtained by reacting benzoic acid, 2-ethyl-hexanoic acid and/or maleic acid with linear/branched monomethyl C16-C17 alcohols. The compositions provided include many unique effects as compared to commercially available benzoate, octanoate and maleate ester products.

DETAILED DESCRIPTION OF THE INVENTION

The novel benzoate, octanoate and maleate esters of this invention have unique properties in that they are substantially non-greasy, lack oiliness and greasiness, have low pour points and low freezing points, have good spreadability, and are stable. These properties make the compositions useful as a vehicle or carrier, emollient or solubilizer for toiletry and cosmetic formulations such as hand creams, bath oils, antiperspirants, perfumes, colognes, cold creams, electric pre-shaves, topical pharmaceutical ointments, lipsticks, skin lotions and creams, skin moisturizers, and finger nail polish, as well as other formulations.

A particularly useful composition of this invention, particularly for use in antiperspirant compositions, sun screening compositions, creams and lotions for skin care, and the like, consists of a benzoate, octanoate and maleate ester of branched monomethyl C16 and C17 alcohols.

The branched monomethyl C16 and C17 alcohol useful in making the benzoate, octanoate and maleate esters of this invention may be represented by the following formula:

In the above formula, branching in the monomethyl branched C16 and C17 alcohol may vary from the second carbon to the fourteenth or fifteenth carbon in the linear chain.

The branched monomethyl C16 and C17 alcohol useful in making the benzoate, octanoate and maleate esters of this invention are sold under the trade name Neodol® 67 by Shell Chemical Co. (Houston, Texas). The preferred chain distribution for the Neodol® 67 alcohol is as follows:

	<u>Preferred Range</u>	<u>Narrow Preferred Range</u>	<u>Typical Preferred Range</u>
C15	2% - 5%	2%	2%
C16	28% - 48%	33% - 43%	38%
C17	33% - 73%	43% - 63%	53%
C18	4% - 12%	6% - 10%	6%
C19	1% - 5%	0% - 4%	1%

An alpha olefin in the presence of a catalyst is converted to a mono-methyl branched internal olefin, which then undergoes a modified OXO process to form a mono-methyl branched alcohol (Neodol® 67).

The benzoate ester of branched monomethyl C16 and C17 alcohol of the invention is a C16 - C17 alkyl benzoate which has the following structure:

The octanoate ester of branched monomethyl C16 and C17 alcohol of the invention is a C16 -17 alkyl octanoate or C16-17 alkyl Ethylhexanoate which has the following structure:

where R = monomethyl branched C16 - C17 alkyl.

The maleate ester of branched monomethyl C16 and C17 alcohol of the invention is a [Di(C16 -17 alkyl) maleate] which has the following structure:

where R = monomethyl branched C16 - C17 alkyl.

In manufacturing the compounds of this invention, benzoic acid or 2-ethyl hexanoic acid or maleic acid is reacted with the hydroxyl group of branched monomethyl C16 and C17 alcohol. Generally, the benzoic acid, 2-ethyl hexanoic acid or maleic acid is reacted with the branched monomethyl C16 and C17 alcohol in stoichiometric amounts with a slight excess of the benzoic acid, 2-ethyl hexanoic acid or maleic acid present. The starting materials are usually employed in stoichiometric proportions, but may be employed in amounts corresponding to from 1 to 1, and most preferably from 1 to 0.8, but can go as low as 1 to 0.5 with excellent results. The reaction may be carried out batchwise or in a continuous manner. A batch process is preferred. A catalyst is present during the reaction. Among the catalysts which may be used are stannous oxalate, methane sulfonic acid, and the like.

The reaction is preferably conducted under an inert atmosphere of nitrogen at a reaction temperature of from 150°C to 300°C, and preferably from 210° to about 250°C. The acid value of the reaction is determined by procedures well known in the art. A reduced acid value indicates completion of esterification. When the acid value indicates that substantially all of the benzoic acid has been consumed, the reaction mass is then cooled to between about 70° to 80°C, and washed with water containing sodium chloride, sodium carbonate and hydrogen peroxide. The reaction mass is then vacuum dried at 125°C with 25" Hg and then cooled to 25°C. The reaction mass is then filtered using filter aids such as diatomaceous earth or a silicate type filter aid. The products of the reaction are clear colorless liquids.

An analysis of the esters of the invention, i.e., Benzoate ester (Ref. No. 130-63); Octanoate Ester (Ref. No. 130-67); and Maleate Ester (Ref. No. 134-26), was conducted as to appearance, color, percentage water, acidity, saponification value, surface tension, spreading coefficient, freezing point, refractive index and specific gravity. The results are presented in Table I which identifies

typical properties of the esters of the invention.

TABLE I

TYPICAL PROPERTIES OF ESTERS OF THE INVENTION

	Benzoate	Octanoate	Maleate
	Ester	Ester	Ester
	(130-63)	(130-67)	(134-26)
5			
<u>Properties</u>			
Actives %	100%	100%	100%

20			
Specific Gravity (25°C)	0.9212	0.8814	0.8950

The esters of the invention are useful in all types of skin care products. Hand and face creams benefit from their unique feel on the skin and spreading properties. Color cosmetics will spread easier and have better wetting and leveling effects in the dispersion of pigments. They also find use in skin care lotions and in perfumes/colognes.

The aforescribed benzoate esters have the following properties:

1. Ease of emulsification
2. Emolliency at body temperature with good after-feel.
3. Better solubilizers for sunscreen actives
4. Lack of greasiness, pleasant skin feel
5. Lack of oiliness while imparting good lubrication
6. Low surface tension
7. Acid and alkaline stability

The esters of this invention are advantageous in that they are non-oily and are useful in skin care compositions, i.e., compositions applied to the skin which soften or soothe the skin and which cosmetically affect the skin. The skin care compositions in which the esters of the invention may be used include, but are not limited to, skin creams, lotions, sun blocks, antiperspirants, deodorants, perfumes, cold creams and skin moisturizers. The foregoing list is only exemplary of the type of compositions in which the benzoate esters of this invention may be used and, as such, is not to be considered limiting.

The amount of ester used in an skin care compositions depends on the type of skin care composition desired, the type and quantity of cosmetic ingredients used and the amount and type of functional additives that are utilized. Typically, the amount of ester used ranges from about 1% to about 20% by weight of the skin care composition. The typical skin care composition further comprises one or more other components selected from the group consisting of surfactants, neutralizers, stabilizers, coloring agents, fragrances, plasticizers, foam stabilizers, film forming polymers, preservatives, antistats, sequestrants, water, dyes, perfume, thickeners, preservatives, plant extracts, and customary additive and auxiliary substances.

Preparation of the esters of the invention is illustrated by the following non-limiting examples. In the examples, as well as throughout this application, the chemical and scientific symbols have their customary meanings and all percentages are weight percentages unless otherwise specified. For ease of identification, each ester is identified by both an Example No. and a Reference No., where applicable.

EXAMPLE #1 (Preparation of Benzoate Ester of Neodol® 67) (Ref. No. 130-63)

In a 1000 ml. four neck round bottom flask equipped with glass stirrer, distillation head, condenser and receiver, added 400.2 grams (1.0 mole) of Neodol 67 (C16 & C17 Alcohol) and 199.8 grams (1.025 moles) of Benzoic Acid. The temperature was raised to 60°C with a good flow of nitrogen. At 60°C, added 0.9 grams of Stannous Oxalate and continued to heat to 240°C maintaining a good flow of nitrogen over 120 minutes, and held for 2 hours at 240°C. The distillate collected was 28 grams against theoretical estimates of 29.5 grams. The ester had the acidity of 3.8 mg. KOH/g. and it was cooled to 40°C. The crude, unwashed ester was filtered through a Filter Press with Whatman Paper #4 at 40°C. The filtered crude ester was treated with 130 grams of deionized water containing 1.30 grams of Potassium Carbonate and 2.00 grams of Potassium Chloride at 80°C. When acidity of the ester was <0.1 mg KOH/gram it was treated with 3.0 grams of hydrogen peroxide. The top layer containing the benzoate ester was collected. It was vacuum stripped at 115°C - 120°C and 20-25 mm of Hg vacuum. The liquid benzoate of this reaction was then treated with 0.2 grams each of Magnesol (Synthetic Magnesium Silicate), Celatom FW 60 (diatomaceous earths) at 50°C. The product was filtered through a Filter Press with Whatman Paper #4. The net yield of the Benzoate Ester product was 535 grams.

EXAMPLE #2 (Preparation of Octanoate Ester of Neodol 67) (Ref. No. 137-67)

In a 1000 ml. four neck round bottom flask equipped with glass stirrer, distillation head, condenser and receiver, added 377.52 grams (1.0 mole) of Neodol 67 (C16 & C17 Alcohol) and 222.48 grams (1.025 moles) of 2-Ethyl Hexanoic Acid. The temperature was raised to 60°C with a good flow of nitrogen. At 60°C, added 1.2 grams of Stannous Oxalate and continued to heat to 240°C maintaining a good flow of nitrogen over 120 minutes, and held for 2 hours at 240°C. The

distillate collected was 26.50 grams against theoretical estimates of 27.81 grams. The ester had the acidity of 6.2 mg. KOH/g. and it was cooled to 40°C. The crude, unwashed ester was filtered through a Filter Press with Whatman Paper #4 at 40°C. The filtered crude ester was treated with 112 grams of deionized water containing 3.2 grams of sodium carbonate and 11.2 grams of sodium sulfate at 80°C. When acidity of the ester was <0.1 mg KOH/gram it was treated with 3.0 grams of hydrogen peroxide. The top layer containing the octanoate ester was collected. It was vacuum stripped at 115°C - 120°C and 20-25 mm of Hg vacuum. The liquid octanoate of this reaction was then treated with 0.2 grams each of Magnesol (Synthetic Magnesium Silicate), Celatom FW 60 (diatomaceous earths) at 50°C. The product was filtered through a Filter Press with Whatman Paper #4. The net yield of the Octanoate Ester product was 545 grams.

EXAMPLE #3 (Preparation of Maleate Ester of Neodol 67) (Ref. No. 134-26)

In a 1000 ml. four neck round bottom flask equipped with glass stirrer, distillation head, condenser and receiver, added 499.8 grams (2.0 moles) of Neodol 67 (C16 & C17 Alcohol) and 100.2 grams (1.025 moles) of maleic anhydride. The temperature was raised to 60°C with a good flow of nitrogen. At 60°C, added 3.0 grams of methane sulfonic acid and continued to heat to 150°C maintaining a good flow of nitrogen over 120 minutes, and held for 2 hours at 150°C. The distillate collected was 16 grams against theoretical estimates of 18.4 grams. The ester had the acidity of 5 mg. KOH/g. The reaction product was treated with 150 grams of deionized water containing 3.0 grams of sodium carbonate, 3 grams of hydrogen peroxide and 15 grams of sodium sulfate at 80°C. The top layer containing the maleate ester was collected. It was vacuum stripped at 115°C - 120°C and 20-25 mm of Hg vacuum. The liquid maleate of this reaction was then treated with 0.2 grams each of Magnesol (Synthetic Magnesium Silicate), Celatom FW 60 (diatomaceous earths) at 50°C.

The product was filtered through a Filter Press with Whatman Paper #4. The net yield of the Maleate Ester product was 546 grams.

Table II below compares the solubility characteristics of the esters of the invention in various solvents. The esters are soluble in most commonly used solvents, emollients and vehicles employed in cosmetic product formulations. The esters of the invention are advantageously versatile due to their Solubility/Compatibility with commonly used emollient esters, mineral oils, etc.

Table II compares the solubility characteristics of three esters of the invention, namely, benzoate ester (Ref. No. 130-63); octanoate ester (Ref. No. 130-67) and maleate ester (Ref. No. 134-26). The solubility is based on 1 gram of ester in 10 gm. solvent.

KEY: + indicates soluble
- indicates insoluble

The two most commonly used solid organic crystalline sunscreens are Benzophenone-3 (2 hydroxy-4-methoxybenzophenone) and Parsol 1789 (butyl-methoxy dibenzoyl methane, also known as Avobenzone). These two solid sunscreens are difficult to dissolve and keep in solution for use in sunscreen formulations for optimal SPF (Sun Protection Factors). Higher solvency for a sunscreen ingredient is desired as it allows higher concentrations of the sunscreen active ingredient in a formulation. This advantageously raises the SPF ratings for the formulations. The liquid organic sunscreens that are commonly used are octylsalicylate (OS) and octyl-methoxycinnamate (OMC). Esters of this invention exhibit superiority over commonly used and marketed cosmetic emollients/materials.

The high solvency exhibited by the esters of the invention for the solid crystalline organic sunscreens is an advantageous effect in formulating sunscreen products for the skin care markets. Thus, besides being cosmetic emollients, these esters are excellent solvents for the above-mentioned sunscreens.

A further aspect of these esters, besides being solubilizers for the sunscreens, is that they render antiwashoff effects. This effect is very attractive in formulating long-lasting sunscreen products allowing the sunscreen to remain on the skin for a longer duration.

TABLE III
SUNSCREEN SOLUBILITIES IN ESTERS (25°C)

<u>Sunscreen</u>	<u>Benzoate</u> <u>Ref. No.</u> <u>130-63</u>	<u>Finsolv</u> <u>TN</u>	<u>Octanoate</u> <u>Ref. No.</u> <u>130-67</u>	<u>Finester</u> <u>EH-25</u>	<u>Maleate</u> <u>Ref. No.</u> <u>134-26</u>	<u>Finester LP</u>
Benzophenone-3	25	15	18	10	14	10
Parsol 1789	18	13	10	7	9	6
Dihydroxyacetone	1	<1	1	<1	<1	<1
Salicylic Acid	5	3	1	<1	<1	<1

Note: The higher the value, the more soluble the ester.

Note: Dihydroxyacetone ("DHA") is a self-tanning agent, i.e., a chemical tanning agent.

Conclusion: The benzoate, octanoate, and maleate esters of monomethyl branched C16-C17 alcohols of the invention are more effective in dissolving solid organic sunscreens as compared to commercially available benzoate esters (i.e., Finsolv TN), octanoate esters (i.e., Finester EH-25) and maleate esters (i.e., Finester LP).

EXAMPLE #4: Preparation of Sunscreen Creams (Ref. Nos. 134-34, 134-35, 134-36)

Esters of the invention, as prepared in Examples #1 through #3 above, will now be compared to commercially available esters. Table IV sets forth the ingredients used to prepare Formulations A through H, which are sunscreen creams.

TABLE IV

Stickiness	1	1	2	3	3	4	5	4
Skin Feel	1	1	1	2	3	4	5	5
Emolliency	1	1	2	2	3	4	5	4

Formulations A, B, and C (the benzoate, octanoate and maleate esters of the invention) exhibited superior slip, water-rinseoff resistance, stickiness, skin feel and emolliency.

EXAMPLE #7: Preparation of Moisturizing Hand and Body Lotions
(Ref. Nos. 134-29, 134-30, 134-31)

Table VII sets forth the ingredients used to prepare Formulations A through H, which are moisturizing hand and body lotions.

TABLE VII
FORMULATIONS A - H
MOISTURIZING HAND AND BODY LOTIONS (Ref. Nos. 134-29, 134-30, 134-31)

<u>Ingredients/Trade Name</u>	<u>A</u>	<u>B</u>	<u>C</u>	<u>D</u>	<u>E</u>	<u>F</u>	<u>G</u>	<u>H</u>

Cerysynt SD	0.8	0.8	0.8	0.8	0.8	0.8	0.8	0.8
Promulgen G	1	1	1	1	1	1	1	1

The procedure for preparing Formulations A - H of Table VII is as follows: Charge water and disperse Carbomer in it. Charge balance of Part I ingredients in order, until each is dissolved. After addition of Triethanolamine, heat to 65°C. Mix Part I ingredients together and heat to 60°C. Add Part II ingredients to Part I ingredients with good mixing to form an emulsion. Continue mixing while cooling to 25°C. All formulations are opaque flowable lotions with pH of 6.5.

Formulations A - H so prepared were tested for skin feel, slip, stickiness, long-lasting moisturizing effect and emolliency on a scale of 1 to 5, with 1 representing the best and 5 representing poor. Results are as follows:

TABLE VII-A
FORMULATIONS A - H
MOISTURIZING HAND AND BODY LOTIONS (Ref. Nos. 134-29, 134-30, 134-31)

	<u>A</u>	<u>B</u>	<u>C</u>	<u>D</u>	<u>E</u>	<u>F</u>	<u>G</u>	<u>H</u>

Moisturizing Effect	1	2	1	2	3	3	5	5
Emolliency	1	1	1	2	3	4	5	4

Formulations A, B, and C (the benzoate, octanoate and maleate esters of the invention) exhibited superior skin feel, slip, stickiness, moisturizing effect and emolliency.

EXAMPLE #8: Preparation of Elegant Skin Crème
(Ref. Nos. 134-50, 134-51, 134-52)

Table VIII sets forth the ingredients used to prepare Formulations A through H, which are elegant skin crèmes. The procedure for preparing Formulations A - H of Table VIII is as follows: Charge the ingredients of Part I, starting with water. Bring the temperature to 70°C to 75°C. Mix well until uniform. Heat ingredients of Part II to 75°C. Add Part II ingredients to Part I ingredients with mixing. Cool to 25°C with gentle mixing. All formulations are soft in appearance with pH of 6.6.

Emolliency	1	1	1	2	3	4	5	5

Formulations A, B, and C (the benzoate, octanoate and maleate esters of the invention) exhibited superior skin feel, slip, stickiness, and emolliency.

EXAMPLE #9: Preparation of Deodorant Sticks (Ref. Nos. 134-44, 134-45, 134-46)

Table IX sets forth the ingredients used to prepare Formulations A through H, which are deodorant sticks.

The procedure for preparing Formulations A - H of Table IX is as follows: Charge the ingredients in the order shown in Table IX, starting with propylene glycol. Bring the temperature to 80°C allowing all to dissolve. Mix well until uniform. Cool to 60°C and cast into stick molds.

TABLE IX
FORMULATIONS A - H
DEODORANT STICKS (Ref. Nos. 134-44, 134-45, 134-46)

<u>Ingredients/Trade Name</u>	<u>A</u>	<u>B</u>	<u>C</u>	<u>D</u>	<u>E</u>	<u>F</u>	<u>G</u>	<u>H</u>

Slip	1	1	2	2	2	3	5	4
Soft Dry After-feel	1	1	1	2	2	3	5	4

Formulations A, B, and C (the benzoate, octanoate and maleate esters of the invention) exhibited superior emolliency, slip and soft dry after-feel.

EXAMPLE #10: Preparation of Non-Whitening Antiperspirant Sticks
(Ref. Nos. 134-38, 134 -39, 134-40)

Table X sets forth the ingredients used to prepare Formulations A through H, which are non-whitening antiperspirant sticks.

The procedure for preparing Formulations A - H of Table X is as follows: Charge the ingredients of Part I, starting with Dow Corning Fluid 345. Bring the temperature to 75°C. Mix well until uniform. Add Part II powders and mix until completely dispersed. Maintain temperature of 75°C. Cool to 55°C and cast into stick molds.

TABLE X
FORMULATIONS A - H
NON-WHITENING ANTIPERSPIRANT STICKS (Ref. Nos. 134-38, 134-39, 134-40)

<u>Ingredients/Trade Name</u>	<u>A</u>	<u>B</u>	<u>C</u>	<u>D</u>	<u>E</u>	<u>F</u>	<u>G</u>	<u>H</u>

	Witconol 2314	Iso Propyl Myristate	Witco Corp, TX
	Witconol APM	PPG-3 Myristyl Ether	Witco Corp, TX

In conclusion, the esters of the invention, namely, the benzoate, octanoate, and maleate esters of monomethyl branched C16-C17 alcohols, are superior in skin feel, emolliency, slip,
5 stickiness, moisturizing effect, etc. as compared to known esters.

It is understood that the embodiments described herein are merely exemplary and that a person skilled in the art may make many variations and modifications without departing from the spirit and scope of the invention. All such modifications and variations are intended to be included within the scope of the invention described herein.
